A look at the difference of Agile Development and the book noted Software development process:

Agile development can be considered more of a team process, as working in pairs is known to be the standard, yet particularly speaking while doing software development processes as many do… it is done individually! There is also the difference between the linear structure of Software development processes and the multi-faced process of dealing with Agile development. Both have their pros and cons, but I would like to surmise that they are both useful depending on the programs intentions and packaging after development has occurred.

For me personally I like to write code and develop programs individually, because I can take 100% credit for the finished products once its produced… yet on the other hand massive projects are by in large completed in a timelier and efficient manner by using agile development!
